

Package ‘flowmapper’

August 30, 2024

Title Draw Flows (Migration, Goods, Money, Information) on 'ggplot2'
Plots

Version 0.1.1

Description Adds flow maps to 'ggplot2' plots. The flow maps consist of 'ggplot2' layers which visualize the nodes as circles and the bilateral flows between the nodes as bidirectional half-arrows.

`add_flowmap` *Add a flow map to a ggplot*

Description

Add a flow map to a ggplot

Usage

```
add_flowmap(
  p,
  flowdat,
  outline_linewidth = 0.01,
  alpha = 0.8,
  nodes_alpha = 0.8,
  outline_col = "black",
  k_nodes = NULL,
  node_buffer_factor = 1.2,
  node_radius_factor = 1,
  edge_offset_factor = 1,
  node_fill_factor = NULL,
  edge_width_factor = 1.2,
  arrow_point_angle = 45,
  add_legend = "none",
  legend_nudge_x = 0,
  legend_nudge_y = 0,
  legend_col = "gray"
)
```

Arguments

<code>p</code>	The plot to which the flowmap should be added.
<code>flowdat</code>	Input dataframe. See details below.
<code>outline_linewidth</code>	The linewidth of the outline of the arrows.
<code>alpha</code>	Opacity of the edges.
<code>nodes_alpha</code>	Opacity of the nodes.
<code>outline_col</code>	Color of the outline of the edges.
<code>k_nodes</code>	Number of clusters to group nodes into. If defined, nodes will be clustered hierarchically based on spatial proximity. By default, no clustering will be applied.
<code>node_buffer_factor</code>	Controls the distance between the nodes and the edges (in multiple of the nodes' radii).
<code>node_radius_factor</code>	Controls the size of the nodes.

edge_offset_factor
 Controls the distance between the parallel arrows.
node_fill_factor
 Controls the downscaling of the fill of the nodes (as to not outshine the edges).
edge_width_factor
 Controls the width of the edges.
arrow_point_angle
 Controls the pointiness of the edges.
add_legend Add a legend for width to the plot? Must be one of "none", "bottom", "top", "left", or "right". (Experimental)
legend_nudge_x Adjusts the horizontal position of the legend in map units.
legend_nudge_y Adjusts the vertical position of the legend in map units.
legend_col If add_legend, controls the color of the legend. Default is grey.

Details

The function requires as inputs a dataframe `flowdat` which contains for every combination of two nodes a and b the coordinates of these nodes as well as the intensity of flow between those nodes in both directions (a to b, b to a). The dataframe should have the following columns:

- **id_a:** The unique id of node a
- **id_b:** The unique id of node b
- **xa:** The x coordinate of node a
- **ya:** The y coordinate of node a
- **xb:** The x coordinate of node b
- **yb:** The y coordinate of node b
- **flow_ab:** The intensity of flow from node a to node b
- **flow_ba:** The intensity of flow from node b to node a

The function will impose `coord_equal()` on the ggplot.

Inspired by [flowmap.gl](#).

Value

The ggplot with an additional polygon layer for the flow arrows and an additional polygon layer for the nodes

Author(s)

Johannes Mast

Examples

```
testdata <-
data.frame(
  id_a = c("X1", "X2", "X3", "X3", "X1"),
  id_b = c("X8", "X7", "X1", "X8", "X7"),
  xa = c(2,14,10,10,2),
  ya = c(6,10,9,9,6),
  xb = c(10,4,2,10,4),
  yb = c(4,10,6,4,10),
  flow_ab = c(2,1,1,1,1),
  flow_ba = c(5,1,1,1,2)
)
library(ggplot2)
plot <- ggplot()
plot |> add_flowmap(testdata)
```

cantons

cantons

Description

Geometries of Cantons of Switzerland. CRS is unassigned, but should be EPSG:3857.

Usage

cantons

Format

cantons:

A sf object with 26 rows and 2 columns:

NAME_1 Name of Canton

geometry polygon coordinates

Source

GADM database <https://gadm.org/>

CH_migration_data *CH_migration_data*

Description

Internal migrations between Cantons of Switzerland, 2011-2016.

Usage

CH_migration_data

Format

CH_migration_data:

A data frame with 325 rows and 8 columns:

id_a, id_b Names of Cantons A and B

flow_ab Number of migrations from A to B

flow_ba Number of migrations from B to A

xa,ya Longitude and latitude of the centroid of Canton A. Web-Mercator projection (EPSG: 3857)

xb,yb Longitude and latitude of the centroid of Canton B. Web-Mercator projection (EPSG: 3857)

Source

Federal Statistical Office of Switzerland, under OPEN-BY-ASK terms of use: <https://www.bfs.admin.ch/bfs/de/home/statistiken/bevoelkerung/migration-integration/binnenwanderung.assetdetail.3222163.html>

get_circle_coords *Helper function to create coordinates for circles of nodes*

Description

Helper function to create coordinates for circles of nodes

Usage

get_circle_coords(center = c(0, 0), r = 1, npoints = 25)

Arguments

center center y and y coordinates

r radius

npoints number of points

Value

a dataframe with x and y coordinates of the circle

Author(s)

Johannes Mast, Credit to <https://stackoverflow.com/a/6863490>

hca_flowdat

Use hierarchical clustering to merge nodes based on proximity

Description

Use hierarchical clustering to merge nodes based on proximity

Usage

```
hca_flowdat(flowdat, k = 20)
```

Arguments

flowdat	The data containing flows from a to b, b to a, and the coordinates of a and b
k	The number of nodes to keep.

Value

a dataframe of the same format as flowdat, but with some nodes (and their flows) merged. Note that this will in most cases contain some circular flows (a to a) even if the input flowdat did not.

short_scale

Create short scale format for numbers in the legend

Description

Create short scale format for numbers in the legend

Usage

```
short_scale(x, digits = 3)
```

Arguments

x	The number
digits	Significant digits
