Package 'bartcs'

May 1, 2024			
Title Bayesian Additive Regression Trees for Confounder Selection			
Version 1.2.2			
Description Fit Bayesian Regression Additive Trees (BART) models to select true confounders from a large set of potential confounders and to estimate average treatment effect. For more information, see Kim et al. (2023) <doi:10.1111 biom.13833="">.</doi:10.1111>

bart

Fit BART models to select confounders and estimate treatment effect

Description

Fit Bayesian Regression Additive Trees (BART) models to select relevant confounders among a large set of potential confounders and to estimate average treatment effect E[Y(1) - Y(0)].

Usage

```
separate_bart(
 Y, trt, X,
  trt_treated
                  = 1,
  trt_control
                  = 0,
                  = 50,
  num_tree
  num_chain
                  = 4,
 num_burn_in
                   = 100,
                   = 1,
 num_thin
  num_post_sample = 100,
  step_prob
                  = c(0.28, 0.28, 0.44),
  alpha
                  = 0.95,
  beta
                  = 2,
                   = 3,
  nu
                  = 0.95,
  dir_alpha
                   = 5,
 parallel
                  = FALSE,
  verbose
                   = TRUE
)
single_bart(
 Y, trt, X,
  trt_treated
                  = 1,
  trt_control
                  = 0,
                   = 50,
  num_tree
                   = 4,
  num_chain
                   = 100,
  num_burn_in
                   = 1,
  num_thin
  num_post_sample = 100,
                  = c(0.28, 0.28, 0.44),
  step_prob
                   = 0.95,
  alpha
  beta
                  = 2,
                   = 3,
  nu
                  = 0.95,
  dir_alpha
                   = 5,
                  = FALSE,
 parallel
                  = TRUE
  verbose
)
```

bart 3

Arguments

Υ	A vector of outcome values.
trt	A vector of treatment values. Binary treatment works for both model and continuous treatment works for single_bart(). For binary treatment, use 1 to indicate the treated group and 0 for the control group.
Χ	A matrix of potential confounders.
trt_treated	Value of trt for the treated group. The default value is set to 1.
trt_control	Value of trt for the control group. The default value is set to 0.
num_tree	Number of trees in BART model. The default value is set to 100.
num_chain	Number of MCMC chains. Need to set $num_chain > 1$ for the Gelman-Rubin diagnostic. The default value is set to 4.
num_burn_in	Number of MCMC samples to be discarded per chain as initial burn-in periods. The default value is set to 100.
num_thin	Number of thinning per chain. One in every num_thin samples are selected. The default value is set to 1.
num_post_sample	
	Final number of posterior samples per chain. Number of MCMC iterations per chain is burn_in + num_thin * num_post_sample. The default value is set to 100.
step_prob	A vector of tree alteration probabilities (GROW, PRUNE, CHANGE). Each alteration is proposed to change the tree structure. The default setting is (0.28, 0.28, 0.44).
alpha, beta	Hyperparameters for tree regularization prior. A terminal node of depth d will split with probability of alpha $* (1 + d)^(-beta)$. The default setting is (alpha, beta) = (0.95, 2) from Chipman et al. (2010).
nu, q	Values to calibrate hyperparameter of sigma prior. The default setting is (nu, q) = (3, 0.95) from Chipman et al. (2010).
dir_alpha	Hyperparameter of Dirichlet prior for selection probabilities. The default value is 5 .
parallel	If TRUE, model fitting will be parallelized with respect to $N = nrow(X)$. Parallelization is recommended for very high n only. The default setting is FALSE.
verbose	If TRUE, message will be printed during training. If FALSE, message will be suppressed.

Details

separate_bart() and single_bart() fit an exposure model and outcome model(s) for estimating treatment effect with adjustment of confounders in the presence of a large set of potential confounders (Kim et al. 2023).

The exposure model E[A|X] and the outcome model(s) E[Y|A,X] are linked together with a common Dirichlet prior that accrues posterior selection probabilities to the corresponding confounders (X) on the basis of association with both the exposure (A) and the outcome (Y).

There is a distinction between fitting separate outcome models for the treated and control groups and fitting a single outcome model for both groups.

4 bart

• separate_bart() specifies two "separate" outcome models for two binary treatment levels. Thus, it fits three models: one exposure model and two separate outcome models for A = 0, 1.

• single_bart() specifies one "single" outcome model. Thus, it fits two models: one exposure model and one outcome model for the entire sample.

All inferences are made with outcome model(s).

Value

A bartcs object. A list object contains the following components.

mcmc_list A mcmc.list object from **coda** package. mcmc_list contains the following items.

- ATE Posterior sample of average treatment effect E[Y(1) Y(0)].
- Y1 Posterior sample of potential outcome E[Y(1)].
- Y0 Posterior sample of potential outcome E[Y(0)].
- dir_alpha Posterior sample of dir_alpha.
- sigma2_out Posterior sample of sigma2 in the outcome model.

var_prob Aggregated posterior inclusion probability of each variable.
 var_count Number of selection of each variable in each MCMC iteration. Its dimension is num_post_sample * ncol(X).
 chains A list of results from each MCMC chain.
 model separate or single.
 label Column names of X.
 params Parameters used in the model.

Examples

```
data(ihdp, package = "bartcs")
single_bart(
 Υ
                 = ihdp$y_factual,
                 = ihdp$treatment,
 trt
                 = ihdp[, 6:30],
 Χ
 num_tree
                 = 10,
 num_chain
                 = 2,
 num_post_sample = 20,
 num_burn_in = 10,
 verbose
                 = FALSE
)
```

count_omp_thread 5

count_omp_thread

Count the number of OpenMP threads for parallel computation

Description

count_omp_thread() counts the number of OpenMP threads for parallel computation. If it returns 1, OpenMP is not viable.

Usage

```
count_omp_thread()
```

Value

Number of OpenMP thread(s).

Examples

```
count_omp_thread()
```

ihdp

Infant Health and Development Program Data

Description

Infant Health and Development Program (IHDP) is a randomized experiment from 1985 to 1988 which studied the effect of home visits on cognitive test scores for infants.

Usage

ihdp

6 plot.bartes

Format

treatment Given treatment.

y_factual Observed outcome.

y_cfactual Potential outcome given the opposite treatment.

mu0 Control conditional means.

mu1 Treated conditional means.

X1 ~ X6 Confounders with continuous values.

X7 ~ X25 Confounders with binary values.

Details

This dataset was first used by Hill (2011), then used by other researchers (Shalit et al. 2017, Louizos et al. 2017).

Source

Our version of dataset is the dataset used by Louizos et al. (2017). This is the first realization of 10 generated datasets and you can find other realizations from https://github.com/AMLab-Amsterdam/CEVAE.

plot.bartcs

Draw plot for bartcs object

Description

Two options are available: posterior inclusion probability (PIP) plot and trace plot.

Usage

```
## S3 method for class 'bartcs'
plot(x, method = NULL, parameter = NULL, ...)
```

plot.bartes 7

Arguments

X	A bartcs object.
method	"pip" for posterior inclusion probability plot or "trace" for trace plot.
parameter	Parameter for traceplot.
• • •	Additional arguments for PIP plot. Check ?ggcharts::bar_chart for possible arguments.

Details

PIP plot:

When a posterior sample is sampled during training, separate_bart() or single_bart() also counts which variables are included in the model and compute PIP for each variable. For bartcs object x, this is stored in x\$var_count and x\$var_prob respectively. plot(method = "pip") uses this information and draws plot using ggcharts::bar_chart().

Traceplot:

Parameters are recorded for each MCMC iterations. Parameters include "ATE", "Y1", "Y0", "dir_alpha", and either "sigma2_out" from single_bart() or "sigma2_out1" and "sigma2_out0" from separate_bart(). Vertical line indicates burn-in.

Value

A ggplot object of either PIP plot or trace plot.

Examples

```
data(ihdp, package = "bartcs")
x <- single_bart(</pre>
 Υ
                  = ihdp$y_factual,
 trt
                 = ihdp$treatment,
                 = ihdp[, 6:30],
 Χ
                 = 10,
 num_tree
 num_chain
                 = 2,
 num_post_sample = 20,
 num_burn_in = 10,
 verbose
                 = FALSE
)
# PIP plot
plot(x, method = "pip")
plot(x, method = "pip", top_n = 10)
plot(x, method = "pip", threshold = 0.5)
# Check `?ggcharts::bar_chart` for other possible arguments.
# trace plot
plot(x, method = "trace")
plot(x, method = "trace", "Y1")
plot(x, method = "trace", "dir_alpha")
```

8 summary.bartcs

summary.bartcs

Summary for bartcs object

Description

Provide summary for bartcs object.

Usage

```
## S3 method for class 'bartcs'
summary(object, ...)
```

Arguments

object A bartcs object.

. . . Additional arguments. Not yet supported.

Details

summary() provides 95% posterior credible interval for both aggregated outcome and individual outcomes from each MCMC chain.

Value

Provide list with the following components

model separate_bart or single_bart.

trt_value Treatment values for each treatment group: trt_treated for the treatment

group and trt_control for the control group.

tree_params Parameters for the tree structure. chain_params Parameters for MCMC chains.

outcome Summary of outcomes from the model. This includes both aggregated outcome

and individual outcomes from each MCMC chain.

Examples

```
data(ihdp, package = "bartcs")
x <- single_bart(</pre>
 Υ
                 = ihdp$y_factual,
                 = ihdp$treatment,
 trt
                 = ihdp[, 6:30],
 Χ
 num_tree
                = 10,
            = 2,
 num_chain
 num_post_sample = 20,
 num_burn_in = 10,
 verbose
                 = FALSE
)
summary(x)
